Grasscycling is a popular trend in home lawn care that refers to leaving grass clippings on top of grass as a natural fertilizer after mowing. It doesn't require special equipment. You can use a regular mower - gas, electric, or reel – or you can purchase a specialized mulching or recycling mower.

**What is GRASSCYCLING?**
A simple practice of leaving grass clippings on the lawn when mowing. Cut it and leave it is an environmentally friendly approach to lawn care. And it saves time and money!

**How do I start?**
Leave the bag off of your mower. Follow the “1/3 rule” by mowing your lawn often so that no more than 1/3 of the length of the grass blades are cut and left on the lawn.

Grasscycling is a 100% organic fertilizer and leaves your lawn greener while cutting back on your yearly fertilizing.

In the summer, grass clippings represent 1/3 of all green garbage and is the main source of pollution in landfills.

**Does it cause thatch?**
In 3 days, the grass clippings break down and restore nutrients to the soil and does NOT cause thatch, creating healthy, greener lawns.
